Advice and analysis

'Gold $ 823 worth'

Tuesday, August 13, 2013 11:30

A new study by scientists Erb and Harveygold appeared. This time they have explored the relationship between gold and inflation. If this relationship is a fundamental appreciation of gold would indicate, the precious metal is worth $ 823 per troy ounce. And a process of overshooting is $ 349 possible.

Claudia Erb and Campbell HarveyTwo scientists with great authority when it comes to resources for research. Earlier (February 26, 2013) I wrote about their study 'The Golden Dilemma. In this study, the scientists tested six arguments used by supporters of investing in gold regularly.

As here illustrated the following pro-gold motivations are given:

1. Gold would be a good inflation protection, or
2. offer good protection against a weakening currency (or gold rises as the currency falls), or
3. a good investment in an environment with low real yields (as now) or
4. a safe haven in times of stress.

In addition, gold would:

1. are attractive because again we would go toward a gold standard (and central banks to buy gold)
2. (strategic) are overweighted in many investment portfolios.

'Gold overvalued'

Briefly Erb and Harvey were in previous studies found no statistical evidence for all six abovementioned arguments. The arguments thus use the adherents of gold investors have yet no (scientific) basis.

In a study entitled ‘The Golden Constant’ they have conducted new research into the potential relationship between inflation and gold. The idea behind this study is to answer the following question: “Suppose there is indeed a relationship between gold and inflation (as is often claimed by supporters of gold investments), what would the gold price be?”

Now, the so-called ‘golden constant’ value of gold would now be $ 823 per troy ounce, which is also shown in the following figure. If there is a process of “overshooting” would take place, can be achieved even $ 349. About Overshooting means that the price beyond the supposed equilibrium point would reach (upwards or downwards).- Hereby sentiments often play a role.

the gold price and inflation or currency exchange rates. If the relationship of inflation and gold prices would exist, gold is now too high.
